# Diamond and CBN tools for honing

## Introduction

WINTER diamond and CBN honing tools have a worldwide reputation for quality and cost-effectiveness.

The range of tools has been constantly expanded and improved in the course of decades of experience in work with industry.

This brochure gives useful notes on selection and application of the appropriate diamond and CBN honing tools.

The recommendations are intended as guidelines. It is not possible to cover all details in a brochure like this, but we are pleased to offer you personal consulting services by our specialist engineers. They can work in consultation with you to specify the appropriate solution for your specific needs.

We are naturally also willing to assist you in optimising existing applications.

# Diamond and CBN honing plates

## Resinoid bonds

### To cut the plates, use:

- a) Hand saw or jig saw
- b) For faster and cleaner cutting, use a diamond cut-off wheel, BZ type
- Diameter : 100 - 150 mm
- Cutting width : 0.6 - 0.8 mm
- Layer specification : D 151 / BZ 309 / C 45

### To attach sticks to holders, use:

- a) UHU-Plus
- b) Technicoll 2000 (Beiersdorf, Hamburg)
- c) Loctite 307 / Activator T Nr. 747
- d) etc.

To detach from holders heat to approx. 300° C in furnace.

Peripheral speed (Diam./CBN)  $v_c = 15$  m/s  
 Peripheral speed (SiC)  $v_c = 23$  m/s  
 Dry grinding

Grit size of diamond & CBN honing sticks	Spekifikation of SiC grinding wheel
D15 / B15	400 HB3
D20 / B30	320 HB3
D46 / B46	240 HB3
D64 / B64	180 HB3
D91 / B91	120 HB3
D126 / B126	80 JB3
D151 / B151	80 JB3
D181 / B181	80 JB3

Note: Grinding direction of honing spindle has to be opposite to operation direction in order to get best use of created grit protusion.

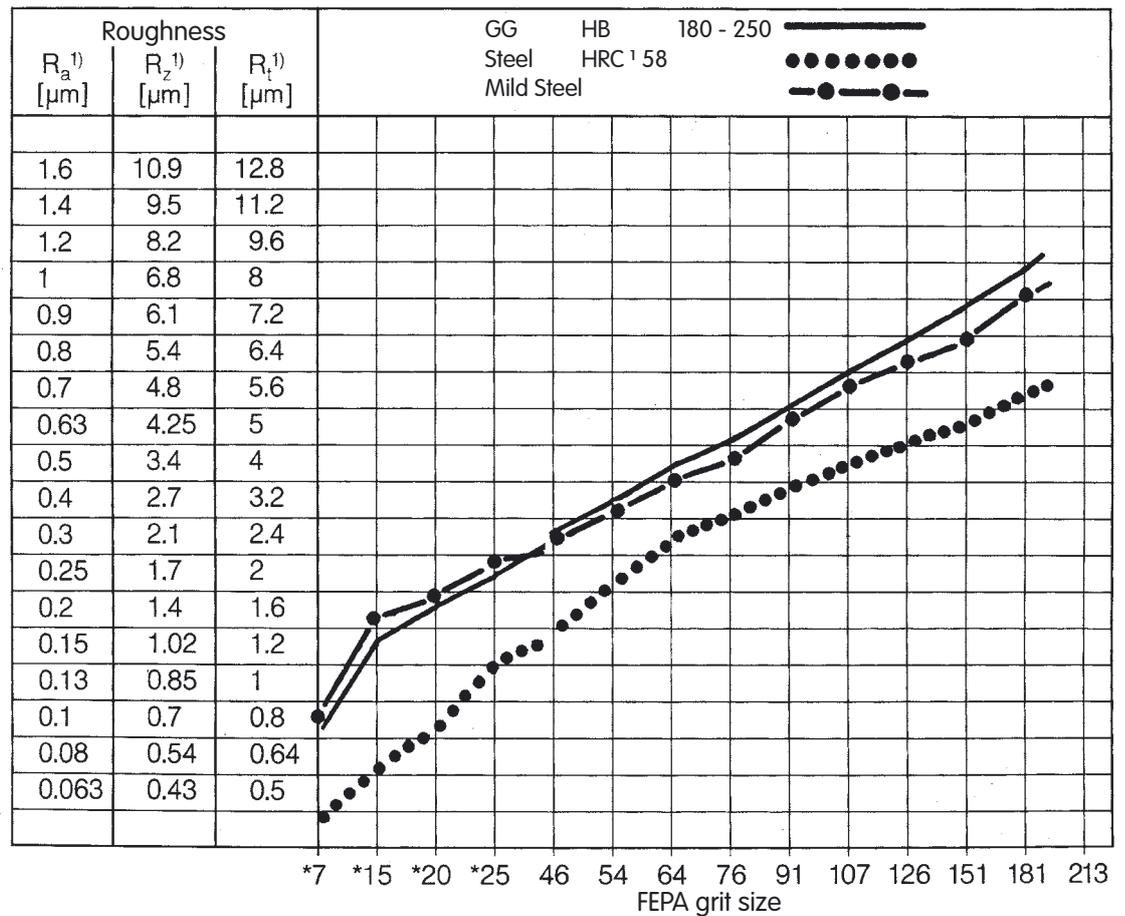

# Diamond and CBN tools for honing

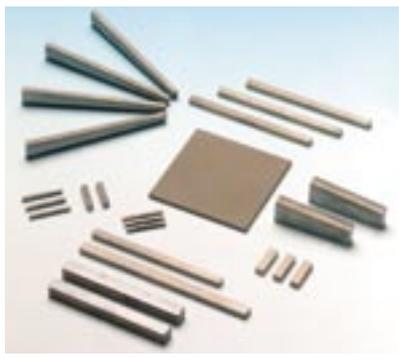

## Attainable surface finishes in honing with metal bond honing tools

The practical data compiled in the following diagram can only be regarded as an orientation aid.

The interdependencies between bond, concentration, workpiece material, operating parameters etc. and the scatter that exists within any grit size specification mean that it is impossible to assign a certain grit size to a certain roughness height.

\* WINTER micron powders  
 1) Calculation basis:  $1 R_a = 8 R_t$ ;  $1 R_t = 0,85 R_z$   
 (see DIN ISO 1302 Annex 2, Tab. 1, footnote 1)

# Diamond and CBN tools for honing

## Operating parameters and grit size

**Cutting speed:**  
The cutting speed ( $v_c$ ) comprises two components, namely the rotation speed of the honing head ( $v_A$ ) and its oscillation speed ( $v_H$ ).

Approximate setting range  
 $v_c = 30-70$  m/min  
 $v_A = 20-60$  m/min  
 $v_H = 30-70$  m/min

Typical speeds in practice  
 52 m/min  
 49 m/min  
 16 m/min

---

**Cross hatch angle:**  
The honing operation results in a typical cross hatch pattern, whereby the cross hatch angle ( $\alpha$ ) is dependent on oscillation speed ( $v_H$ ) and rotation speed ( $v_A$ ) of the honing head.

$$\tan \frac{\alpha}{2} = \frac{v_H}{v_A}$$

These two speeds are normally set in such a way that the cross hatch angle is between 25° and 60° (typical angle in practice: 36°)

---

**Specific contact pressure:**  
20-200 N/cm<sup>2</sup> (exceptionally up to 600 N/cm<sup>2</sup>)

---

**Coolant:**  
The honing process normally uses honing oils on a mineral oil base, and watersoluble emulsions.  
Flow per bore: 30-150 l/min

**Grit size**  
The superabrasive grits used in the tools are classified to the FEPA standard from B46/D46 upwards. Tools can also be manufactured to customer requirements, outside of the production programmes described here. Please contact us for special requirements. We also provide a plating service for tool bodies sent to us by customers. For determination of the size of the finished tool, the undersize of the tool body must be calculated depending on the grit size to be used.
